1.1:

There are 5 entity classes in the schema. They are *course*, *professor*, *student*, *teaches*, and *transcript*.

1.2:

The cms-ddl.sql file is used to initialize and create the 5 relations needed for this assignment (entity classes listed above). Also defined for these relations in this file are their columns, data types, primary keys, and foreign keys. The cms-ddl.sql file itself is used in the CMS.dbconfig, and the schemas are used throughout the code to query on (specifically under org/example/queries).

1.3:

The foreign keys of the *transcript* table are *studentID* (from *student* relation) and *courseID* (from *course* relation).

1.4:

The *FindStudent* query contains a single parameter, which is *studentID*, and shown as "*:studentID"*.

1.5:

According to the CMS.dbconfig, the database is stored in an in-memory (on RAM) DuckDB database, and its data is stored in CSV files.
